Veracity

Calm, plain warnings for live phone calls.

DESIGN SYSTEM & FRONT-END SPEC · V1

Veracity

Live AI-voice & scam-call detection for normal phone calls. This document is the visual system and screen-by-screen design for the React dashboard, built to the Veracity Project Document v1.1.

FOR	DATE	STACK
Hackathon 2026 team · 30–31 Oct	7 October 2026	React · Vite · FastAPI WebSocket

Inside

1. Principles, voice and fixed copy
2. Colour, type, spacing
3. The dashboard flow and live events
4. The four screens
5. Components
6. Logo and notes

The demo call, number and scores in the screens are invented for illustration. Don't quote them as measurements.

Calm, plain, trustworthy

The people using Veracity may be frightened, older, or in the middle of being pressured. The design should feel like a good public service, not a hacker console.

Principles

- **Calm until it matters.** Paper-light screens. Colour goes on risk, nothing else.
- **Say what to do, not just what's wrong.** Every warning ends in a safe action.
- **Never colour alone.** Every risk state pairs colour with a shape (circle-check, triangle, octagon) and a word.
- **Show the evidence.** Numbers, times and quotes are exact and set in mono.
- **Privacy is visible.** “Offline” sits in the header on every screen.

Voice

- Second person, short sentences, sentence case. No emoji, no exclamation marks.
- Name the scam in the user's words (“digital arrest”). Model words (`LIKELY_AI`, 0.82) stay in metadata and the JSON.
- Hedge honestly: “Likely AI”, “calibrated estimate, not proof”. Never “Confirmed fake”.
- Quote callers exactly, in their language (English, Hinglish, Devanagari).
- Numbers display as `+91 70456 18823` and are stored as E.164 `+917045618823`. Helpline **1930** and cybercrime.gov.in are written out.

Fixed copy

Where	Text
Live alert	**Don't share an OTP or send money.** Hang up, then call back on a number you have saved. (+ what was detected)
Report next steps	Lost money? Call 1930 now and file at cybercrime.gov.in. · No money lost? Report the number on Chakshu within 30 days of the call.
Disclaimers	“The AI-voice % is a calibrated model estimate, not proof.” · ML % always shows “trained on synthetic data”. Never show the model card's 98.82%.
Limits	Veracity can't reveal the real number behind a spoofed call or locate the caller.

One light theme, one brand, three risk steps

Risk runs blue → amber → orange-red, so it never depends on telling red from green. The plain token is for text and icons, `-soft` for backgrounds, `-fill` for meter bars and chart marks (never text). `ink` is 15.7:1 on white, `ink-muted` 7.0:1, `brand` 7.9:1. All text pairs pass WCAG AA.

#ffffff **surface-000** Raised surfaces: panels, cards, inputs, the app header.	#f6f5f1 **surface-100** Page background	#ecebe4 **surface-200** Wells and sunken areas: table headers, the transcript gutter, meter tr	#d9d6cc **line** Hairline dividers and panel borders

Words in Public Sans, evidence in Plex Mono

Public Sans is a civic face: neutral and very legible. Anything the user may need to read back exactly (percentages, phone numbers, timestamps, model states, JSON) goes in IBM Plex Mono with tabular figures. Both are open-licence (OFL) and the font files ship with the system.

Style	Sample	Size	Use
`display`	**Is this call real?**	`40px/44px · 700`	One per screen at most: the setup hero and the report verdict.
`title`	**Live call**	`28px/34px · 650`	Page titles.
`heading`	AI-voice likelihood	`18px/26px · 600`	Panel titles.
`subheading`	Red flags in this call	`15px/22px · 600`	Section labels inside panels, list item titles.
`body`	Veracity listens on your computer. Nothing leaves this machine.	`15px/24px · 400`	Default text and transcript lines.
`body-sm`	Updated every second · 4-second windows	`13px/20px · 400`	Help text, captions, metadata.
`label`	Save call audio	`13px/16px · 600`	Buttons, field labels, badges.
`overline`	CALLER	`11px/16px · 700`	Uppercase eyebrow above a value. Write the text in capitals; don't rely on CSS transform.
`metric`	82%	`36px/40px · 500`	The big AI-voice percentage and risk score.
`number`	+91 98765 43210	`18px/24px · 500`	Phone numbers in E.164 or national format.
`code`	`00:42 LIKELY_AI 0.82`	`13px/20px · 400`	Timestamps, model states, confidence values, the JSON evidence preview.

Spacing (4px base)

`space-1` 4px · `space-2` 8px · `space-3` 12px · `space-4` 16px · `space-5` 24px · `space-6` 32px · `space-7` 48px · `space-8` 64px

Radii

`radius-sm` 4px · `radius-md` 8px · `radius-lg` 12px · `radius-pill` 999px

Depth and focus

Borders do the work. `shadow-panel` only lifts a panel off the paper. Focus is a 2px solid `brand` ring with a 2px offset on every control.

3 · FLOW

One dashboard, four steps

The website is the React dashboard on the laptop (`http://localhost:5173`). The steps follow the project document's Figure 2, and a progress bar in the header shows where the user is.

Step	What happens	API
1 Check setup	One row per check: backend, phone over adb, scrcpy, audio input, models. A failure shows the exact fix command. Fake mode shows SIMULATION MODE.	`GET /api/health`
2 Check number	Number card: validity, series, country, original operator, reports, rule score with points, ML % with reasons, search and Chakshu links. Then “Start monitoring”.	`POST /api/number/analyze` `POST /api/session/start`
3 Live call	Everything is driven by the WebSocket (below). “End call & build report” stops capture.	`WS /ws/live/{id}` `POST /api/session/{id}/stop`
4 Report	Risk level, score and reasons, red flags, Download JSON, Call 1930, cybercrime.gov.in, Chakshu, optional community report.	`GET /api/report/{id}` `POST /api/number/report`

Live events → components

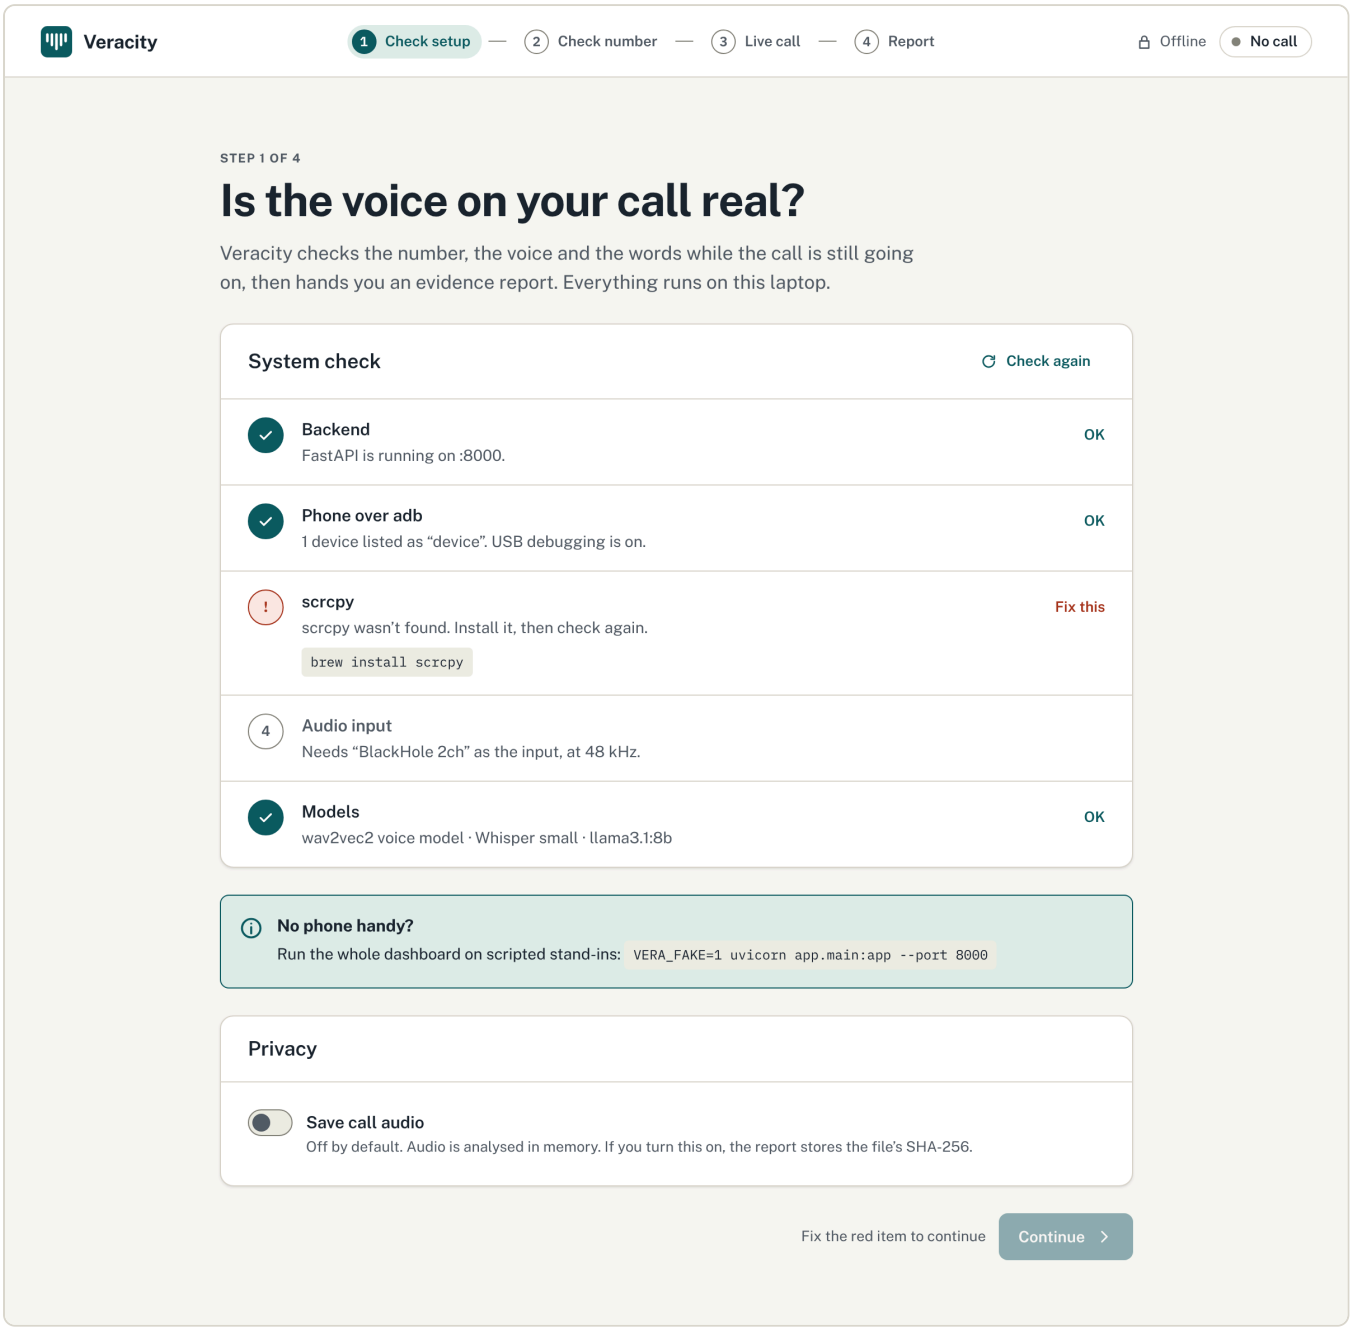

Event	Fields	Component
`level`	t, dbfs	LevelMeter (silence gate −45 dBFS)
`voice`	t, p_ai, smoothed, state, speech	ScoreMeter (smoothed + backend state) and a ScoreTimeline point; no speech → gap
`transcript`	t, text	Transcript line (caller's side only)
`flag`	category, severity, evidence, t, source	RedFlag, and the evidence is marked in the transcript
`script`	score	ScoreMeter kind="script"
`alert`	kind, message	Danger AlertBanner
`report`	report	Report screen
`ended`	—	CallStatus → ended, close the socket

Rules the UI must respect

- Voice: UNCERTAIN at smoothed ≥ 40. LIKELY_AI only after 3 windows in a row ≥ 75. Always show the backend's `state`; never work it out in the browser.
- Overall = 0.25 × number + 0.40 × voice peak + 0.35 × script. Voice ≥ 85 or script ≥ 80 alone is enough. HIGH ≥ 70, MEDIUM ≥ 40, else LOW.
- One primary button per screen. At most one banner per screen.

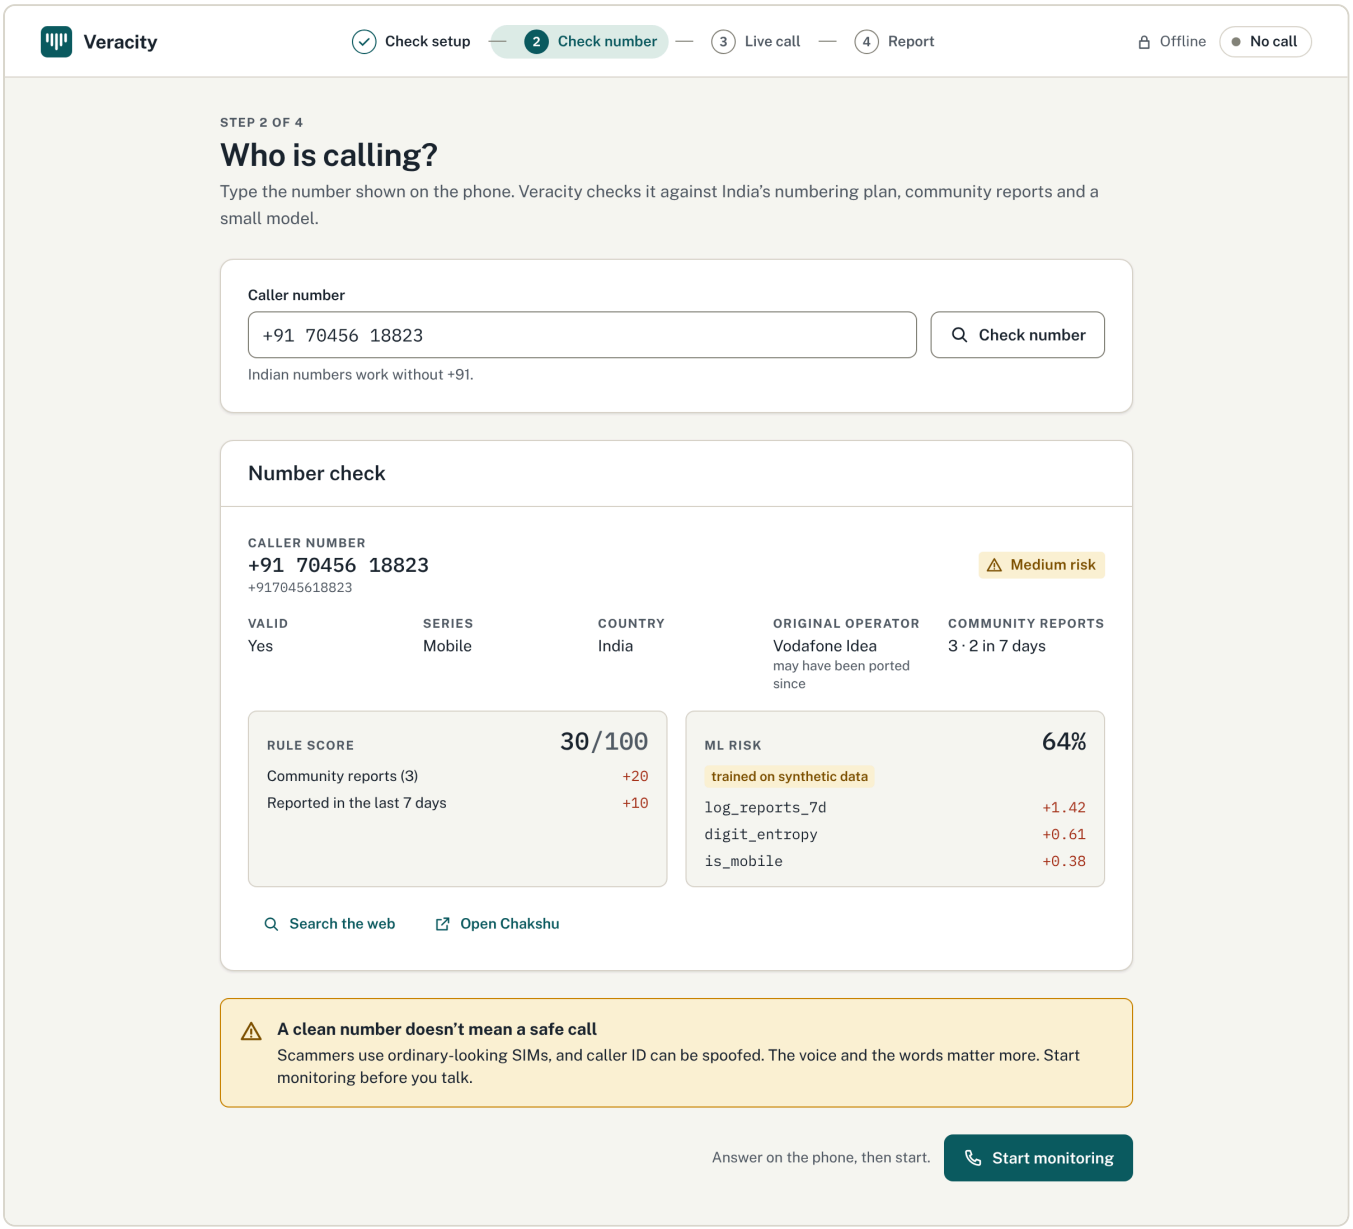

Step 1 · Check setup

GET /api/health on load. A failed check shows its fix command. Continue stays disabled until everything passes, or simulation mode is on.

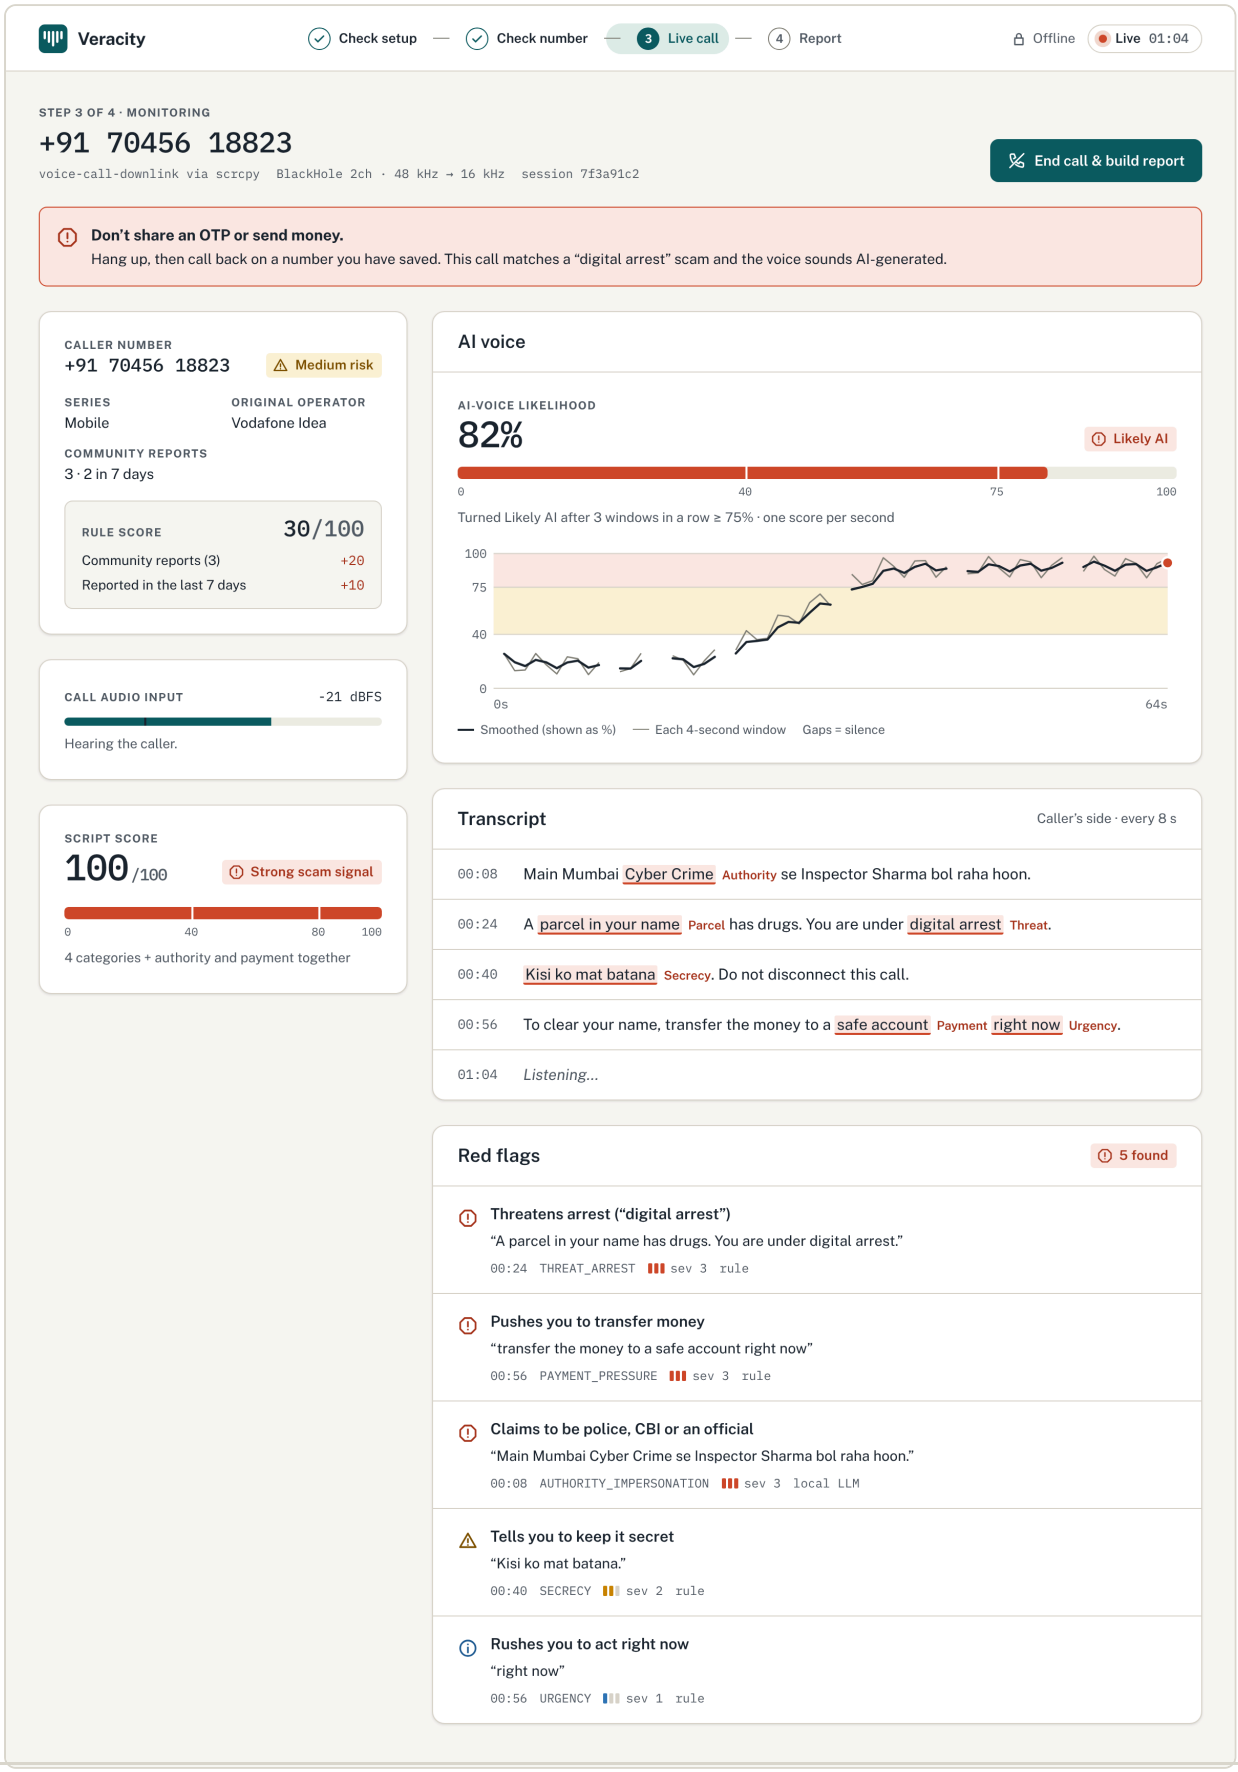

Step 2 · Check number

Rule score and ML % each show their reasons. The warning reminds users that a clean number isn't a safe call.

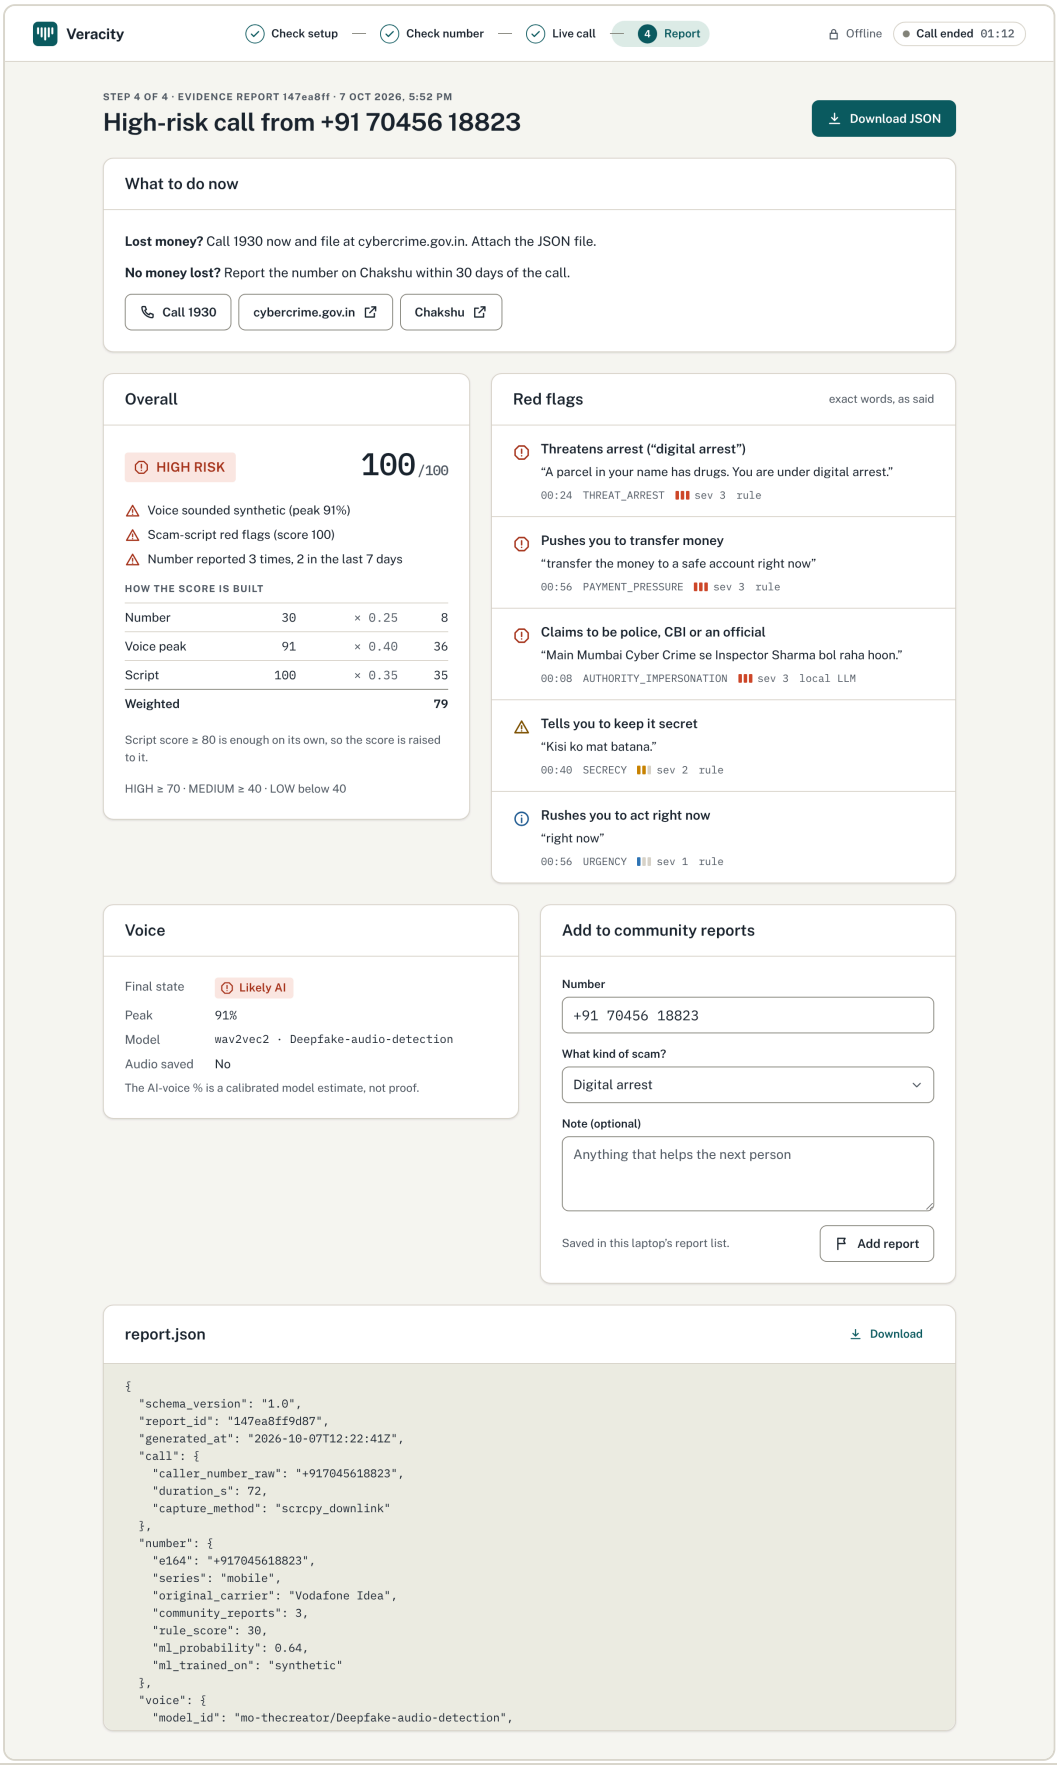

Step 3 · Live call

Left: number, input level, script score. Right: AI voice with timeline, transcript, red flags. The red alert appears on the alert event.

Step 4 · Report

What to do first, then the score and how it was built, the evidence, the community report, and the JSON for 1930 / cybercrime.gov.in / Chakshu.

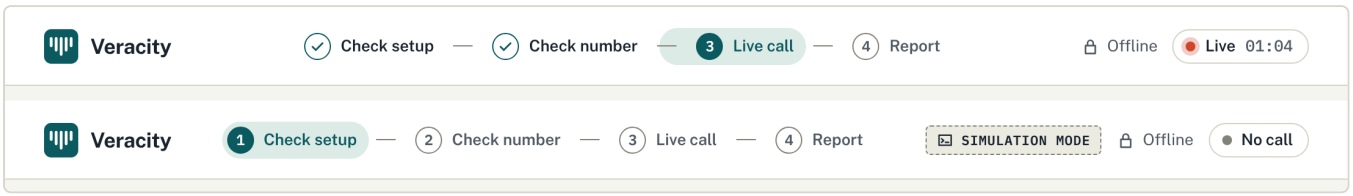

20 React components, one stylesheet

Every value comes from the tokens. The library is `window.Veracity` (bundle.js + bundle.css). Prop types are in index.d.ts, usage notes in each component's README.

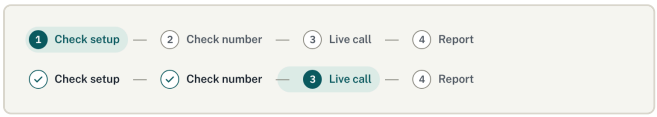

`AppHeader`

The 64px top bar.

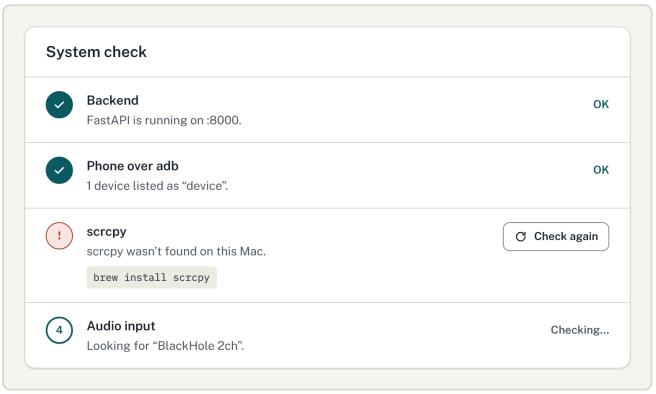

`FlowSteps`

The four steps of the dashboard journey in project document Figure 2.

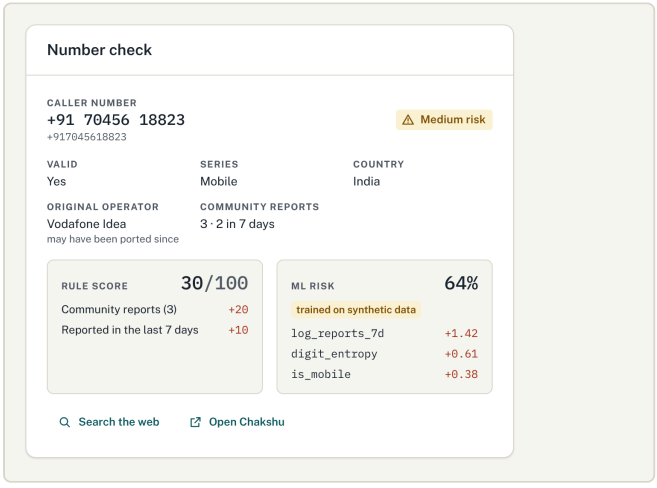

`SetupStep`

One row of the system check built from GET /api/health.

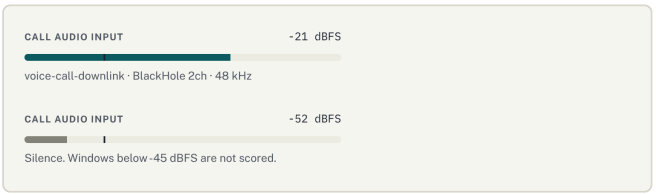

`NumberCard`

Everything POST /api/number/analyze returns, with the reasons.

`LevelMeter`

The `level` event.

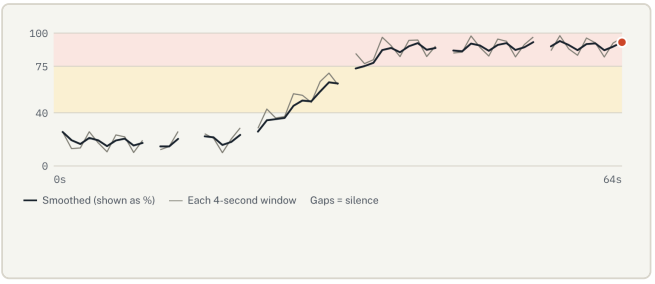

ScoreMeter

Two meters.

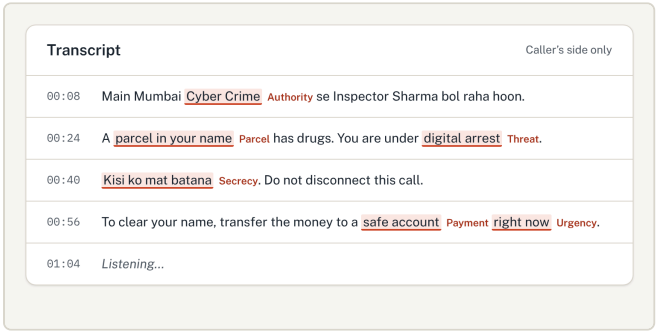

ScoreTimeline

Chart of the `voice` events.

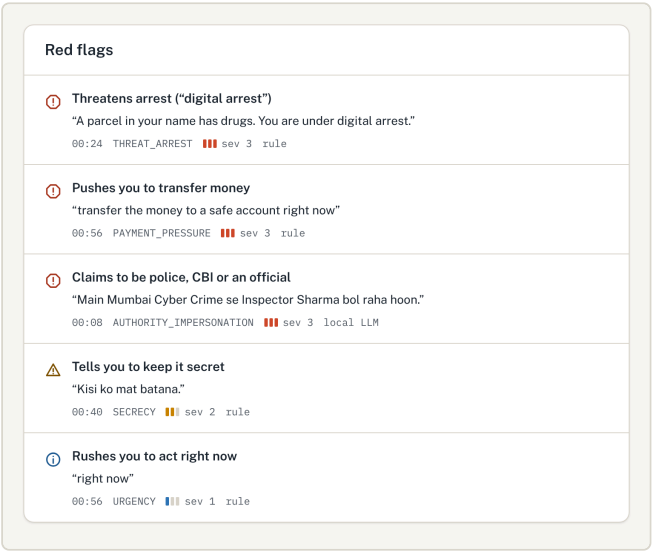

Transcript

The `transcript` events as a log.

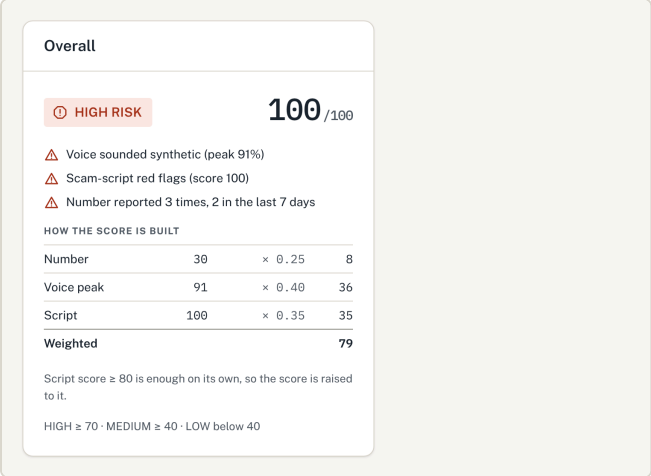

RedFlag

One `flag` event.

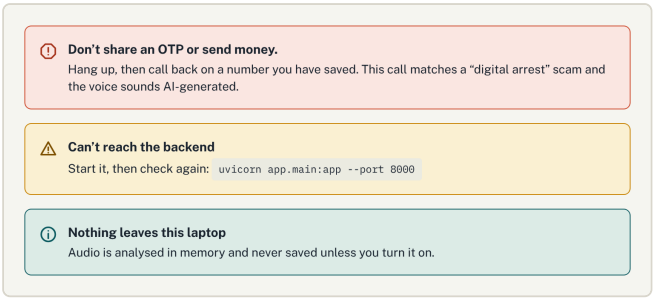

RiskSummary

The report's `overall`.

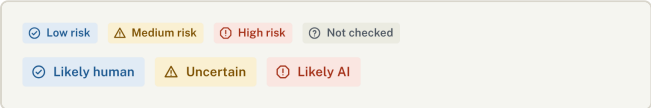

AlertBanner

Full-width message.

RiskBadge

Risk in one or two words.

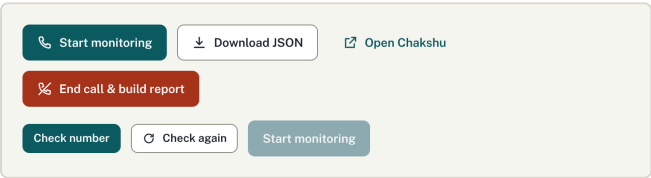

CallStatus

Call state in the header.

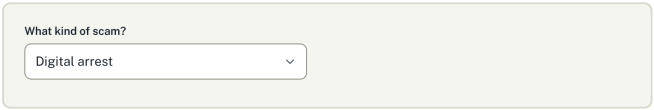

Button

Actions.

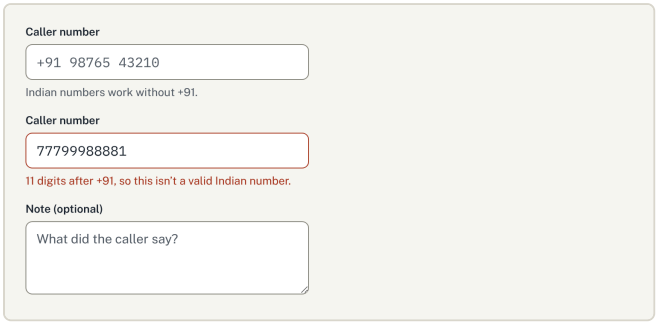

Select

Labelled native select with a chevron.

TextField

Labelled input.

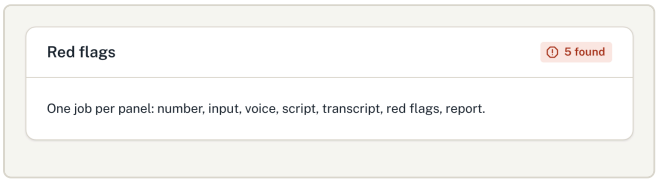

Toggle

On/off switch with a label and a one-line consequence.

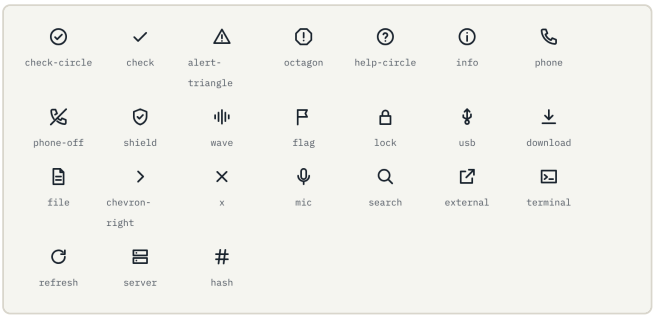

Panel

The white card every screen is built from.

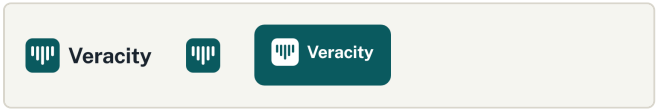

Icon

Veracity's own 24px outline icons.

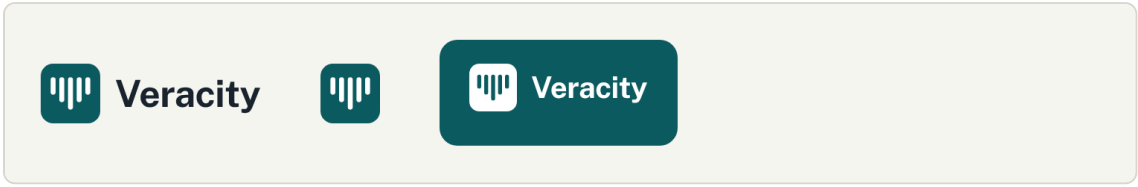

Logo

The Veracity mark (five audio bars whose ends trace a V) with the wordmark.

The mark

Five rounded audio bars whose ends trace a V, on a `brand` tile, next to “Veracity” in Public Sans Bold. Keep clear space of half the mark's height. Never place it on a risk colour. It's an original placeholder mark the team can replace.

Charts in Recharts

If the team builds the voice chart with Recharts, keep it the same: an `ink` line for smoothed, a 1.25px `line-strong` line for raw windows, soft amber and soft orange reference areas at 40–75 and 75–100, no fill under the lines, mono 11px axis labels, and `connectNulls={false}` so silence shows as gaps.

Motion

Only three things move: the live dot (it pulses and stops under reduced motion), the meter fills (0.4s) and the input level (0.1s). Calm is the point.

Where it comes from

The Veracity repo's front end (commit 463ef95) is still the unstyled Vite starter, so nothing visual came from code. Screens, states, thresholds and copy follow **Veracity Project Document v1.1** (6 October 2026). Tokens, fonts, logo files and live components are in the Veracity design system artifact.

Previews use invented demo data: number +91 70456 18823, a scripted “digital arrest” call, and made-up scores.
